FULLY FEATURED

The **ReVu Query** product is an affordable, integrated suite of programs which allow for the direct interrogation of your underlying database(s).

Comprehensive online help, sets of functions and operations that can be used against the database fields of the query is available throughout the software.

Have you ever wished you had access to more reports? With ReVu Query you can build, save and run reports at any time.

The Internal **Report Writer** embedded within the Query product; allows for complete customization of any of the report sections. You can add your company logo, include your corporate colours and output the reports to any desired format.

A **Scheduler** Tool is also included, allowing predefined queries to be submitted on a regular basis (e.g.: daily, weekly, monthly, and annually). The scheduled reports can be sent via E-mail or fax; to multiple recipients and can also be set to print to a predefined printer.

ReVu Query also includes **User Defined Functions (UDF's)**. This clever feature eliminates the need for calculations to be defined every time a query is run.

Pre-defined calculated fields (totals, multiply, divide, percentage and others) can be built into your query. The query containing the UDF is processed on your server, using your data and the results are displayed in a format nominated by you.

There is a Powerful **Charting** capability that allows for results to be graphically displayed and linked back to the results grid.

Results can be split into up to 3 hierarchies (for example: customers in one grid, orders of selected customer in a second grid, and order lines of selected order shown in a third grid). In addition, the results may be sorted and grouped up to 16 levels.

After executing a query in the ReVu Query product; results can be directly exported to XML, Excel, and CSV or directly into a ReVu graphical report.

ReVu Query has an in-built **User Security** option which allows you to save sensitive queries as 'Private'. Queries flagged as 'Private' will be hidden from other users.

The ReVu **Dashboard** allows multiple queries to be shown on a single dashboard container.

The goal of the dashboard is to automatically display critical information pertaining to your business as you go about your day. You decide when and how often the dashboard information is updated.

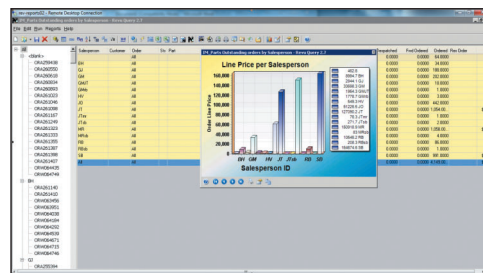

There is also a 'Sub Dashboard' Drill-down facility that allows you to drill down from one dashboard to a completely different one - there is no limit to the levels of drill-down that are required.

Queries that are shown both as a chart and grid are automatically hyper-linked, clicking on a piece of a pie chart will automatically reposition to the associated row on the grid.

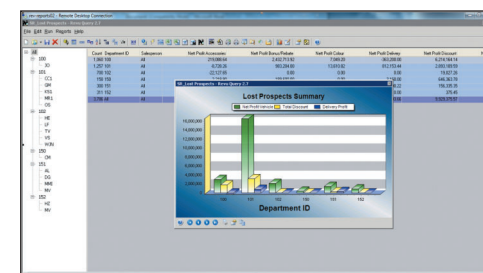

RSS Feeds (most commonly translated as 'Really Simple Syndication') may also be added as objects to the container. RSS feeds are a family of web feed formats used to publish frequently updated works, such as blog entries or **news and sports headlines**. These feeds can either be from XML documents that reside locally on your network or on the internet.

The ReVu Query is the perfect solution for intelligent interrogation of underlying database(s)
